Daniela Marquez

Backend Engineer

Austin, TX | daniela.marquez@example.com | (555) 010-0141

SUMMARY

Backend engineer with 6 years building high-throughput payment and logistics services in Java and Spring Boot. Comfortable owning a service from design through on-call. Strong background in event-driven design, data consistency and production reliability.

TECHNICAL SKILLS

Languages: Java 17, Kotlin, SQL, Bash
Frameworks: Spring Boot, Spring Cloud, Hibernate, JUnit, Mockito
Messaging and data: Apache Kafka, RabbitMQ, PostgreSQL, Redis, MongoDB
Cloud and tools: AWS (EC2, S3, SQS, RDS), Docker, Kubernetes, Jenkins, Gradle, Grafana, Git

EXPERIENCE

Software Engineer II, *Brightlane Payments* **Mar 2021 - Present**

- Built a settlement service in Java and Spring Boot that processes 1.2M transactions per day with p99 latency under 180 ms.
- Moved nightly batch reconciliation to Kafka consumers, cutting end-of-day processing from 4 hours to 35 minutes.
- Introduced idempotency keys and a PostgreSQL outbox table, eliminating duplicate charges after retries.
- Wrote contract tests with Pact and raised unit test coverage on the payments module from 54% to 86%.
- Led the on-call rotation for 5 engineers and wrote runbooks that reduced mean time to recovery by 40%.
- Designed a rate limiting layer with Redis and token buckets that protects partner APIs from bursts of up to 5,000 requests per second.
- Added distributed tracing with OpenTelemetry and Grafana Tempo, which cut time to find the slow hop in a request from hours to minutes.
- Reviewed about 40 pull requests a month and wrote the team guide for Spring Boot service structure and error handling.

Software Engineer, *Harborview Logistics* **Jul 2018 - Feb 2021**

- Developed REST APIs for shipment tracking used by 300 partner companies, documented with OpenAPI.
- Tuned slow Hibernate queries and added Redis caching, lowering database load by 45%.
- Containerized 8 legacy services with Docker and deployed them to Kubernetes on AWS.
- Built a notification service on RabbitMQ that delivers 600k emails and SMS messages a day with retry and dead letter queues.

PROJECTS

Open-source: kafka-lag-exporter fork *(Java, Kafka, Prometheus)*

- Contributed consumer lag metrics for Prometheus and fixed a memory leak under high partition counts.

Ledger Kata *(Java 17, Spring Boot, PostgreSQL)*

- Double-entry ledger service with optimistic locking and property-based tests; used as an interview exercise at my team.

EDUCATION

B.S. Computer Science, Lakeshore State University (2018)

CERTIFICATIONS

- AWS Certified Developer - Associate
